Stardock Object Desktop torrent is a free  
Multi-platform application that's main  
purpose is for real-time music mapping  
and digital audio mapping. Q: Ended PHP  
session between server and client I am  
using a simple PHP login script for my web  
application. The main server's session is  
used for the whole application. I set it up  
using `$_SESSION['logged_in']=true`. After  
the user logs in, the server changes his/her  
session to 'current'. At this point, the user  
can use the application for as long as  
he/she wants, until the server's session  
ends. My issue is that when the user  
navigates away from the application (i.e.  
closes the browser), the server tries to

---

switch the session back to 'current', but the  $\$_SESSION['logged\_in'] = \text{false}$ . This is obviously a problem, because the user will be automatically logged out. Question: How can I keep the session alive after the user stops using the application? A: Instead of extending the session only store the username/id in the session and keep a login count in the db. As soon as the user logs out the session is cleared and the count is reseted. The user's current session (corrected) is stored in the db. This way the user is aware of the fact that he/she is logged out. (IE even when you move to a different page the session still exists) Q: Finite Simple Groups Containing Only Focal Points Let  $S = \text{PSL}_2(p)$  be a (finite) simple group. We know that  $S$  is a focal simple group. This means that there is a subgroup  $L$  of  $S$  such that  $S = C_S(L)$ . Suppose further that  $C_S(L) = S$ . Does this mean that  $S$  contains only trivial-central-focal point

---

elements? Or can there be focal points not in the normalizer of a subgroup of  $S_n$ ? A: The only finite simple groups containing a  $2A_4$
