Data interchange AutoCAD Serial Key saves a drawing in a DXF file, which is a data interchange format used for the exchange of technical drawings, that consists of a group of vector elements and text. It is a drawing based on GIS (Geographical Information System) principles, meaning that geometrical features such as points, lines, planes, and polylines (curves) are the basis of the DXF file. Objects are described with polylines (see polyline). Each polyline or line is a series of points that are connected together to describe a shape or an object. Text and numbers, and sometimes images are included within the drawing as well. These files are sometimes also known as DWG or DGN (Drawing) files. An alternative format is the separate.DWG file format, which uses a similar file structure. Notes References Sources Bilz, R. (2009). About 100 people a day are losing a limb in the UK, according to the BMA. It says the decline in standards in the UK's health care sector is leading to "unnecessary" amputations. The problem is partly caused by a growing culture of over-reliance on operations to treat non-medical conditions, the BMA says. The group recommends that health care costs are contained by stopping money going on "under-performing" services, and people are made "better and more stable" before they need surgery. BMA council chair Dr Mark Porter said the report demonstrates the need for new "global guidelines" for health care, but admits that is unlikely to happen in the UK. "We haven't done a great deal of research into the problems that we have here in the UK, but certainly we do have problems," Porter told BBC News.
