****Changing File Formats**** Photoshop files are not only created in different file formats but also come in many different sizes. Most of the time you can figure out what format a file is in by looking in the bottom left corner of a preview window in Photoshop. If a format is in green and the size is represented by a number or two digits, it is in a common format. RGB and CMYK color spaces are examples of common formats. If a format is in yellow and the number or two digits is larger than 300 (or some other number that doesn't apply), the format is an image format that you need special software to change to. For example, a TIFF file needs a special program to open it, and a JPEG needs a program to modify it. The process of changing a file format to a new or supported format is called converting the format of the file. If a file is already in a format that you need, there is no need to convert it to a new file format. For example, you probably don't want to convert your JPEG to TIFF. Depending on the type of file and the type of process you want to use, you will need to use some software to change it. One common way to do this is to use Photoshop or GIMP to import the file and then use an image-editing program to export it.

The present invention relates to a multi-way optical connector, and more particularly to a multi-way optical connector which can readily be assembled or adjusted. U.S. Pat. No. 4,852,754 discloses a multi-way optical connector which includes first and second optical lenses. A housing includes a pair of projections each of which has a supporting surface extending in a direction from an axis of the housing to a side of the housing. The first and second optical lenses are respectively supported by the supporting surfaces of the projections. With the housing supported on a pair of complementary sockets, the projections can be pressed from the sockets into the sockets for the purpose of adjustment. Accordingly, a locking ring is attached to the projections so that an adjustment range for the projections can be fixed at a fixed value. The above-mentioned optical connector has the disadvantage that the housing must be taken out of its socket and reattached to the socket before the projections can be pressed from the sockets into the sockets for adjustment.

Q: GLSL : return from shader is black I'm just learning OpenGL at the moment, and I'm building a stereoscopic node rig for online content using the Project Neon web framework. I have a shader that uses the anisotropic filter with the following code: ... vec4 res = texelFetch(tex,...); res = texture(tex,...); ... I pass the scene into my shader before rendering, which takes the rendered scene and sends it to the shader as a uniform: #version 300 es void main(void) { ... Uniform tex("stereoram", vec2(sceneTex.width / 2, sceneTex.height / 2), 0); ... This is then used in the fragment shader: in float stereoram; out vec4 color; void main() { gl_FragColor = texelFetch(texture(textureSampler, gl_FragCoord.xy), gl_FragCoord.z, 0); //gl_FragColor = vec4(texelFetch(texture(textureSampler, gl_FragCoord.xy), 0, 0), gl_FragCoord.z); } Both of these work as expected, but when the shader draws, it fills the scene with a black color. I have
