As with any update, less used functions might not be as smooth as they were in previous versions. That's why I was very surprised to find my project pane was not being accessed by default, meaning it needs to be inspected by means of a right-click before it appears in the window. It's also a minor point that I observed an empty folder in the Projects pane's "Library" tab. As for the new matching functionality, I find myself more interested in this than time-lapse functionality. A lot of people use Lightroom for serious photo editing, so this is the kind of functionality that you would use, maybe. Now, you can search for images of the same subject type (landscape, portrait, etc.) and Lightroom will show you any images it thinks match your criteria. This is very cool. The only drawback I see so far from the search results is the sometimes frustrating lack of any basic information. In other words, you have to hunt for information about the image itself. On the other hand, the new Lens Correction tool is really something! You can tell it how to respond to distortions, problems adjusting to different lighting situations, and loose shadows and highlights that naturally result from camera shake. Manual color correction has been made easier with the introduction of six slider bars with live spot overlays, a new quick color panel, and a picture profile auto-detection tool. There are also new features for Lens Correction including new RAW data for GPU accelerated workflows.

That is what we are going to start answering here for the first tutorial! We are going to start off by simply detailing what the 'layers' panel actually represents. The Layers Panel is where all of your images are separated into layers. When you open up an image, Photoshop will load all of the layers into a very early stage of the project to be used. This is so you have easier access than having to load all of the layers one at a time. Layers are separated by grouping them together and this allows for them to be easily accessed and modified. You can then use the original layer as a template for the layer and then build upon it. 933d7f57e6

The Adjustments panel provides a host of tools to alter your layers such as healing, bluring or variations. You can also use the panel to change the primary and secondary colors.
