Let's get one piece of info straight right away: it's about time Adobe improved Lightroom's performance. Lightroom was once a bin-and-batch reading experience, but with each new release, Adobe became progressively slow. I remember seeing Lightroom take 50-60 minutes to read and process a folder of images. The old Lightroom 4.3 required roughly 1 second for my large annual stock shoot, while Lightroom 5 requires 6 seconds. I am glad that the new version of Lightroom is faster, at least about 3-4 times. However, I am surprised and disappointed – to say the least – that Lightroom is still not the snappy chappy it used to be and can sometimes be a bit sluggish. It also won't update the Develop module as quickly as it used to. It was literally takes 10 seconds for the Develop module to update (I timed it) with Lightroom 4.3. Lightroom 5 takes around 2-3 seconds. I'm still waiting for Lightroom to display the information in the proper proportions, so the engine runs faster, too. The only advantage of the new version in my opinion is stabilization with Lens Optimization – and that's not a small issue. On my PC, Lightroom works perfectly now, as it always does, even after a shutdown and start-up. Lightroom is snappy and blazing fast, and very user-friendly. I reiterate one thing: I find no use at all for Photoshop's virtual product catalog. Lightroom 5 does what it's supposed to do, it performs perfectly yet still works competitively with Lightroom 4. As stated in the "Performance Issues" section, it is likely that I will stay with the old version – but that's only because it's familiar to me. For when I do decide to use Photoshop, or some other software, I will probably go back to CS5.6.

Photoshop allows you to take advantage of native APIs in a performant way, we have dedicated graphical shaders to create the most realistic 3D environments on the GPU APIs. We have also focused our efforts to work on a full image-editing pipeline, bringing together most of the image editing capabilities that will have a native feel and an easy experience to work with. This new execution loop is designed to allow you to work at native speeds, while preserving the quality of the image. So that you can easily get up and running quickly, Photoshop implements a core feature set that will enable a smooth transition from the legacy API. Photoshop creates, layers, bookmarks, saves, and loads images in BMP, JPEG, JPG, PNG, and TIFF formats, which can be edited or displayed on a CSS canvas. Image adjustment and image rendering are done using a Graphics Processor Unit (GPU). The new native pipeline for Photoshop allows you to perform image editing and rendering work simply and flexibly using the native capabilities now available to the GPU. Through the use of native shaders, this pipeline gives image editing and rendering more smoothness and precision as compared to the legacy graphic API. Our pipeline includes 2D image editing layers, a 3D effects system for rendering, feathering, painting, and transparency control on a per-layer basis, antialiasing for smooth rendering, and rendering previews on CSS canvases. While hand-tuned shaders work beautifully on the GPU, they are also used for speed and quality when working on the CPU. We have written many small shaders that can be used in a variety of ways at run time. These shaders are written to take advantage of the native APIs and provide maximum performance and flexibility. We have also optimized the native API image handling code to be highly efficient, with efficient memory access that can be easily leveraged by the shaders.

You might not be familiar with the feature, but it is one of the most significant features in Adobe Photoshop. It is the only feature that can be used to decrease the size of your PSD documents without reducing the quality. In Photoshop CC, you can now use the **Vector Aware** feature to bring layered artwork to life in stunning 3D. Add compositing and sculpting tools and bring your designs to life. Today, when the graphic designers look at the print and web design market, they find almost everything and nothing in Photoshop. In designing a poster, a web page and an ebook, any graphic designer uses different tools and designed the same thing in Photoshop (just after a PDF formatter), which becomes a very strong and popular entry to the market. Likewise, incredible web and print designers today use different software and mix it up with a text editor, but all of them have used at least Photoshop as a backbone. Web designers and experts have the same expectations with those who design mobile applications or brochures. Some heavyweights are even switching to own systems. Looking at the industry scene, you can see a copious number of commercials, websites, print ads, and posters, which essentially tell the same stories with different creative solutions. Yet, there are enough examples which are being innovated and redesigned with creative solutions enabled by different tools. These are the reasons that we require Photoshop for editing images, searching for and

designing a text, doodling on any surface, or creating a brochure or an ebook. The software is not only a powerful tool for editing your image, but it is equipped with lots of graphics knowledge. It has updated features like character animation, web, video or apparel designs, markups, 3D tools or even a screen recorder. You will find amazing new features, and also updates in object and path editing or tool options.
